Kai.M., Wada,I., Imai.S., Sakane,F. and Kanoh,H.
Identification and cDNA cloning of 35-KDa phosphatidic acid
phosphatase (type 2) bound to plasma membranes. Polymerase chain
reaction amplification of mouse H202-inducible h1c53 clone yielded
the cDNA encoding phosphatidic acid phosphatase

At the 3' end, an XhoI site was engineered in to allow subcloning into pET2Id, which also puts 6 histidines at the C-terminus that were used for purification. Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                     cobayashi, H., Stewart, E., Poon, R., Adamczewski, J.P., Gannon, J. and

12 Introducing random point mutations into nucleic acods -
Throughous stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.

12 misincorporation, completion of molecules and screening.

13 Sandom point mutations were introduced into the alpha fragment of
15 Random point mutations were introduced into the alpha fragment of
15 Random point mutations were introduced into the alpha fragment of
16 E-coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to
16 operate a popn of DNA molecules which terminate at all
17 possible nucleotide positions within a specified region. The
18 variable 3' ends generated in this way are used as primers for
18 reverse transcriptase. Nucleotides are misincorporated by the
18 remscriptase and the molecules are completed to forms that can be
18 maplified and then expressed in a suitable host-vector system.
18 C The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ymrttthhyrrmrbnvyrdynrsdaaawyccyrrsvkydccynachhddhyvybbbvynv 145

Introducing random point mutations into nucleic acods -
Thy prepr of single stranded template, annealing a primer, elongation,
PT misincorporation, completion of molecules and screening.

PS Random point mutations were introduced into the alpha fragment of
E. Coil beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonuclectide was hybridised to
E. Coil beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonuclectide was hybridised to
E. Coil beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonuclectide was hybridised to
E. Coil beta-galactosidase. Nucleotides with terminate at all possible nucleotide positions within a specified region. The reverse transcriptuse. Nucleotides are misincorporated by the transcriptuse and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                               7 ggcgssvhsyyv-vhvvshhhsvhhvvhhvhvsvvvvhhvvhvvhhvhvhvvsvctcaa 65

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of 1 (Q5135). It hybridized to all spp. of mycobacteria tested, 1 cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

PT Generifying proceins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins or pertaining a recombinant vector library expressing fusion proteins comprising a blading domain and an effector domain promprising a blading domain and an effector domain prospecial and blading domain and an effector domain processories and processories as follows: X(NNB) LITGC)(NNB) 62(NNB) 7(TGC)(NNB) 10%. X and X are flanking restriction sites (X is not the same as Y) that are not processoried further. Other generic sequences are shown in 700466-68. Other specific peptides generated by these generic sequences are shown in 700466-68. Other specific peptides generated by these generic sequences are shown in 700466-68. Other specific peptides generated by these generic sequences are shown in 70046-68. Other specific peptides generated by these generic sequences are shown in 70046-68. Other specific between the 2 domains The Japanous or peptides portion that is chemically or biologically active. They may further comprise a linker appealed between the 2 domains. The oliver of contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compens. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, eq. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the concolonal or polyclonal antibodies and therefore circumvent the need for concolonal or polyclonal antibodies and therefore circumvent the need for compens methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
Generic DNA sequence to generate a random TSAR petide library.
TSAR, totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment, generic; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PPT referring proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain proteins by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain proteins by a binding domain and an effector domain can also be represented as follows: X(NNB) EG(NNB)12(NNB)16(TGC)(NNB)17. X ond Y are flanking restriction sites (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in Graffic peptides generated by these generic sequences are shown in Graffic peptides generated by these generic sequences are shown in Graffic peptides generated by these generic sequences are shown in Graffically for a ligand and second effector peptide portion that is chemically or biologically active They may further comprise a linker peptide between the 2 domains: The Oligomicleotides are also designed confer some degree of conformational rigidity to the peptides. These residues confer some degree of conformational rigidity to the peptides. They are active for confer some degree of conformational rigidity to the peptides. They can conformation of maching to the specific target or on the readlostope, peptide, toxin or enzyme, to the specific target or on the complex methods of hybridoma formation of macromolecules, eg. The Arrest and rapid defection in vivo antibody production.

The SARS are easily characterised and therefore circumvent the need for the real are easily characterised and therefore circumvent the need for the real are easily characterised and therefore circumvent the need for the real are and rapid defection in vivo antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                   Generic DNA sequence to generate a random TSAR petide library.
TSAR, totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  144 CCCTCACAGCCCCGGGGACACTCGGTTAGTGCCGAGGGGGTTCGTGTGCCAGCCGGGGA 85

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hingerprinting bis consistent of a target polynucleotide Disclosure; Page 19; 71pp; English.

Determining the nucleotide sequence (I) of a target polynucleotide CT) comprises: (a) generating from T a plurality of fragments that cover T; (b) attaching an oligonucleotide tag from a repertoire of tags, to each fragment such that all the same fragments have the same tag, and all different fragments have different tags; (c) sorting the fragments by specifically hybridising the tags with their respective tag complements; (d) determining (I) of a portion of each of the fragments; and (e) determining (I) of T by collating the sequences of the fragments. The tagging system can be used with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the sequences of the framments. The tagging system can be used with single base sequencing methods to sequence polynucleotides up to single base sequencing methods to sequence polynucleotides up to thousands of fragments of a target polynucleotide to be sorted onto one or more solid phase supports and sequenced simultaneously. This sequence represents a primer which could be used to reverse transcribe mRNA. If the amplified product is then needed to be attached to a solid phase support a sequence like the one given in 11423 may be used. The mRNA would then be removed and the second strand of CDNA produced using a primer with a similar form to that described in T14324. After restriction enzyme digestion, the conjugate would have the formula described in T14325.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 ttttttttttttttttggwwcwwcwwcwwcwwcwwcwwcwwcww 55

and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in 070466-68.

Other specific peptides generated by these generic sequences are shown in 86511-54. Takes are concatenated by these generic sequences are shown in affailty for a ligand and a second effector peptide portion that is affailty for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 eysteine residues positioned in, or flanking, the unpredicted or variant residues positioned confer some degree of conformational rigidity to the peptides. The TSARs or compens. Comprise comprision a TSAR binding domain can be used in vivo to radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. metal ion, proclonal antibodies and therefore circumvent the need for complex methods of hybridoms formation or in vivo antibody production. The TSARs are easily characterised and have designed and each the section of a second conduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins occuprising a binding domain and an effector domain bisclosure. Page 35, 255pp; English.

010467 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides This generic formula can also be represented as follows: X (NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)1Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in 070466-68.

Other specific peptides generated by these generic sequences are shown in R55151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is elemically or biologically active. They may further comprise a linker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             106 GCCTCGGCACTAACCGAGTGTTCGCGGGGGCTGTGAGGGGAGGGCCCCGGGCGCCCATTGC 165

peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARS or compans, comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or necessity complex methods of hybridomal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing

French Rossian (1921) and the following a recombinant vector library expressing fusion proteins recenting a recombinant vector library expressing fusion proteins are compliant vector library expressing fusion proteins by screening a recombinant vector library expressing fusion proteins. PS comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English STILS generic formula can also be comprehent Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB) GTGC) (NNB)112(NNB)14(TGC) (NNB)3Y. X and Y are flanking restriction sites (X is not the same as Y) that are not x specific peptides generated by these generic sequences are shown in CC comprising at least two functional regions - a binding domain with a finity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with a finity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker of peptide between the 2 domains. The oilgonuclectides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues residues positioned in, or flanking, the unpredicted or variant residues. There residues confers some degree of conformational rigidity to the peptides. The TSARS or comprising a TSAR binding domain can be used in vivo to deliver a chemically or bloogically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the Generic DNA sequence to generate a random TSAR petide library.

comprising a binding domain and an effector domain
bisclosure; Page 36; 25pp; English.

CO0470 is a generic DNA sequence used to generate random TSAR (Totally
synthetic Affinity Reagents) peptides; This generic formula can also be
spresented as follows: K(NNB)4(CAC)(NNB)8(CAC)(NNB)8

CCC (CAC)2(NNB)Y. X and Y are flanking restriction sites (X is not the same
as Y) that are not specified further. The peptides generated by this and
other generic sequences (7074173) have invariant histidine residues
incorporated into variant sequences. TSARs are concatenated
beterofunctional proteins or peptides, comprising at least two functional
regions - a binding domain with affinity for a ligand and a second
effector peptide portion that is chemically or biologically active. They
may further comprise a linker peptide between the 2 domains. The TSARs
or compans. comprising a TSAR binding domain can be used in vivo to
deliver a chemically or biologically active molety, eg. metal ion,
cradioisotope, peptide, toxin or enzyme, to the specific target or on the
monoloual or polytopal antibodies and therefore circumvent the need

Per Presson to the combinant vector library expressing fusion proteins accenting a recombinant vector library expressing fusion proteins accenting a recombinant vector library expressing fusion proteins accenting a recombinant vector library expressing fusion proteins by a binding domain and an effector domain blaschest a binding observed as a binding of sequence used to generate random TSAR (Totally Symbhetto Affiliatly Reagents) peptides. This generic formula can also be represented as follows: X(NNB) In(TCC)(NNB) IN(TCC)(NNB) IOV X and X are flanking restriction sites (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in CX 65151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with a fleat two functional regions - a binding domain with a first lead the expressed peptide contains. They may further comprise a linker of peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in or flanking, the unpredicted or variant residues. These residues confict some degree of conformational rigidiaty to the peptides. The recompsish comprising a TSAR binding domain can be used in vivo to addisorope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. metal ion, callowing direct mathodies and therefore circumvent the need for four complex methods of hybrididams formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
Generic DNA sequence to generate a random TSAR petide library.
TSAR: totally synthetic affinity resegent; synthetic; binding domain;
effector domain; concatenated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
